Databases

OIE Demo

This project shows some features of our database using a node server and Angular. It is a single page application split into two sections. The first section shows the result of 1, 2, and 4. A select box lets a user decide which university system they want, and shows all the students that are applying to the other's university. This solves use case 1 and 2. For each student, there is a button that shows the classes they are applying to. This solves use case 4.

The second tab shows the semester that a student is applying for. It operates in a similar fashion to the first tab and displays all the users in a table after selecting the home university, along with their semester they are applying for. This solves use case 3.
